

Acceptance Rate By Date

What is the overall friend acceptance rate by date? Your output should have the rate of acceptances by the date the request was sent. Order by the earliest date to latest.

Assume that each friend request starts by a user sending (i.e., `user_id_sender`) a friend request to another user (i.e., `user_id_receiver`) that's logged in the table with `action = 'sent'`. If the request is accepted, the table logs `action = 'accepted'`. If the request is not accepted, no record of `action = 'accepted'` is logged.

Table: `fb_friend_requests`

`fb_friend_requests`
